

The motive of this task is to create a practical based learning assignment which assess whether an individual knows a particular concept or not.

Make a small app which demonstrates the topic “useRef hook” in React.

Also write testcases in cypress for that app.

You should use CRA as a boilerplate for react app.

After the App using that concept is done, copy the whole source code of the app to another folder named boilerplate.

Remove the bits from the copied code such that the testcases you wrote earlier are failing (IMPORTANT:- Remove only the bits which use that topic, not other stuff).

Also write an Assignment text explaining what the user has to do to solve the assignment given the boilerplate.

Please put the code in a github repo and send the link.
